

Python Q&A; Set 1 – Basics

Questions with clear answers for learning and interview preparation

1. What is Python?

Answer: Python is a high-level, interpreted, general-purpose programming language known for readable syntax.

2. What is a variable?

Answer: A variable is a name that refers to a value. Example: age = 21.

3. What are common Python data types?

Answer: Common types include int, float, str, bool, list, tuple, set, dict, and NoneType.

4. What is dynamic typing?

Answer: Python determines a variable's type at runtime, so you do not normally declare its type explicitly.

5. What is the difference between == and is?

Answer: == compares values, while is checks whether two references refer to the same object.

6. What does input() return?

Answer: input() reads user input and returns it as a string. Convert it with int() or float() when needed.

7. What is type casting?

Answer: Type casting converts a value from one type to another, such as int('10').

8. What is indentation?

Answer: Indentation defines code blocks in Python. Incorrect indentation can cause an IndentationError.

9. What is the difference between / and //?

Answer: / performs true division, while // performs floor division.

10. What is a comment?

Answer: A comment is text ignored by Python. A single-line comment starts with #.
